that make them dissatisfied.

One More Time: How Do You Motivate Employees? By Frederick Herzberg

Introduction

When Frederick Herzberg researched the sources of employee motivation during the 1950s and 1960s, he discovered a dichotomy that stills intrigues (and baffles) managers: The things that make people satisfied and motivated on the job are different in kind from the things

Ask workers what makes them unhappy at work, and you'll hear about an annoying boss, a low salary, an uncomfortable work space, or stupid rules. Managed badly, environmental factors make people miserable, and they can certainly be demotivating. But even if managed brilliantly, they don't motivate anybody to work much harder or smarter. People are motivated, instead, by interesting work, challenge, and increasing responsibility. These intrinsic factors answer people's deep-seated need for growth and achievement.

Herzberg's work influenced a generation of scholars and managers- but his conclusions don't seem to have fully penetrated the American workplace, if the extraordinary attention still paid to compensation and incentive packages is any indication.

Forget praise. Forget punishment. Forget cash. You need to make their jobs more interesting.

How MANY ARTICLES, books, speeches, and works hops have pleaded plaintively, "How do I get an employee to do what I want?

The psychology of motivation is tremendously complex, and what has been unraveled with any degree of assurance is small indeed. But the dismal ratio of knowledge to speculation has not dampened the enthusiasm for new forms of snake oil that are constantly corning on the market, many of them with academic testimonials. Doubtless this article will have no depressing impact on the market for snake oil, but since the ideas expressed in it have been tested in many corporations and other organizations, it will help - I hope - to redress the imbalance in the aforementioned ratio.

" Motivating " with KITA

In lectures to industry on the problem, I have found that the audiences are usually anxious for quick and practical answers, so I will begin with a straight- forward, practical formula for moving people.

What is the simplest, surest, and most direct way of getting someone to do something? Ask? But if the person re-sponds that he or she does not want to do it, then that calls for psychologi-cal consultation to detemline the rea-son for such obstinacy. Tell the person? The response shows that he or she does not understand you, and now an expert in communication methods has to be

brought in to show you how to get through. Give the person a monetary incentive? I do not need to remind the reader of the complexity and difficulty involved in setting up and adminis-tering an incentive system. Show the person? This means a costly training program. We need a simple way.

Every audience contains the "direct action" manager who shouts, "Kick the person!" And this type of manager is right. The surest and least circumlocuted way of getting someone to do something is to administer a kick in the pants - to give what might be called the KITA.

There are various forms of KITA, and here are some of them:

Negative Physical KITA. This is a lit-eral application of the term and was frequently used in the past. It has, how-ever, three major drawbacks: 1) It is in-elegant; 2) it contradicts the precious image of benevolence that most orga-nizations cherish; and 3) since it is a physical attack, it directly stimulates the autonomic nervous system, and this often results in negative feedback-the employee may just kick you in return. These factors give rise to certain taboos against negative physical KITA.

In uncovering infinite sources of psychological vulnerabilities and the appro-priate methods to play tunes on them, psychologists have come to the rescue of those who are no longer permitted to use negative physical KITA. "He took my rug away";" I wonder what she meant by that"; "The boss is always going around me"-these symptomatic expressions of ego sores that have been rubbed raw are the result of application of:

Negative Psychological KITA. This has several advantages over negative physical KITA. First, the cruelty is not visible; the bleeding is internal and comes much later. Second, since it af-fects the higher cortical centers of the brain with its inhibitory powers, it re-duces the possibility of physical back-lash. Third, since the number of psychological pains that a person can feel is almost infinite, the direction and site possibilities of the KITA are increased many times. Fourth, the person admin-istering the kick can manage to be above it all and let the system accomplish the dirty work. Fifth, those who practice it receive some ego satisfaction (one-upmanship), whereas they would find drawing blood abhorrent. Finally, if the employee does complain, he or she can always be accused of being para-noid; there is no tangible evidence of an actual attack.

Now, what does negative KITA ac-complish? If I kick you in the rear (phys-ically or psychologically), who is mo-tivated? I am motivated; you move! Negative KJTA does not lead to moti-vation, but to movement. So:

Positive KITA. Let us consider moti-vation. If I say to you, "Do this for me or the company, and in return I will give you a reward, an incentive, more status, a promotion, all the quid pro quos that exist in the industrial organization;' am I motivating you? The overwhelming opinion I receive from management people is, "Yes, this is motivation?"

I have a year-old schnauzer. When it was a small puppy and I wanted it to move, I kicked it in the rear, and it moved. Now that I have finished its obe-dience training, I hold up a dog biscuit when I want the schnauzer to move. In this instance, who is motivated-I or the dog? The dog

wants the biscuit, but it is I who want it to move. Again, I am the one who is motivated, and the dog is the one who moves. In this instance all I did was apply KITA frontally; I exerted a pull instead of a push. When industry wishes to use such positive KITAs, it has available an incredible number and va-riety of dog biscuits (jelly beans for hu-mans) to wave in front of employees to get them to jump.

Have spiraling wages motivated people? Yes, to seek the next wage increase.

Myths About Motivation

Why is KITA not motivation? If I kick my dog (from the front or the back), he will move. And when I want him to move again, what must I do? .1 must kick him again. Similarly, I can charge a per-son's battery, and then recharge it, and recharge it again. But it is only when one has a generator of one's own that we can talk about motivation. One then needs no outside stimulation. One wants to do it.

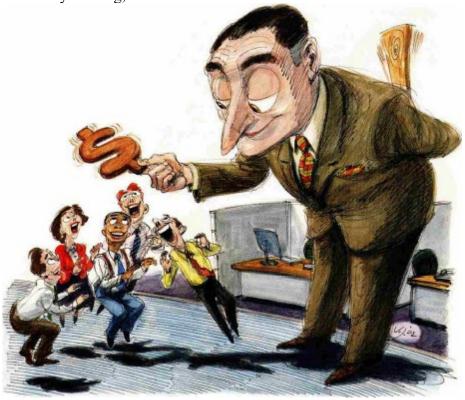

With this in mind, we can review some positive KITA personnel practices that were developed as attempts to in-still "motivation":

- 1. Reducing Time Spent at Work. This represents a marvelous way of mo-tivating people to work -getting them off the job! We have reduced (formally and informally) the time spent on the job over the last so or 60 years until we are finally on the way to the "6½-day weekend?' An interesting variant of this approach is the development of off-hour recreation programs. The philosophy here seems to be that those who play together, work together. The fact is that motivated people seek more hours of work, not fewer.
- 2. Spiraling Wages. Have these moti-vated people? Yes, to seek the next wage increase. Some medievalists still can be heard to say that a good depression will get employees moving. They feel that if rising wages don't or won't do the job, reducing them will.
- 3. Fringe Benefits. Industry has out-done the most welfare-minded of welfare states in dispensing cradle-to-the-grave succor. One company I know of had an informal "fringe benefit of the month club" going for a while. The cost of fringe benefits in this country has reached approximately 25% of the wage dollar, and we still cry for motivation.

People spend less time working for more money and more security than ever before, and the trend cannot be reversed. These benefits are no longer rewards; they are rights. A 6-day week is inhuman, a 10-hour day is exploitation, extended medical coverage is a basic de-cency, and stock options are the salva-tion of American initiative. Unless the ante is continuously raised, the psycho-logical reaction of employees is that the company is turning back the clock.

When industry began to realize that both the economic nerve and the lazy nerve of their employees had insatiable appetites, it started to listen to the be-havioral scientists who, more out of a humanist tradition than from scientific study, criticized management for not knowing how to deal with people. The next KITA easily followed.

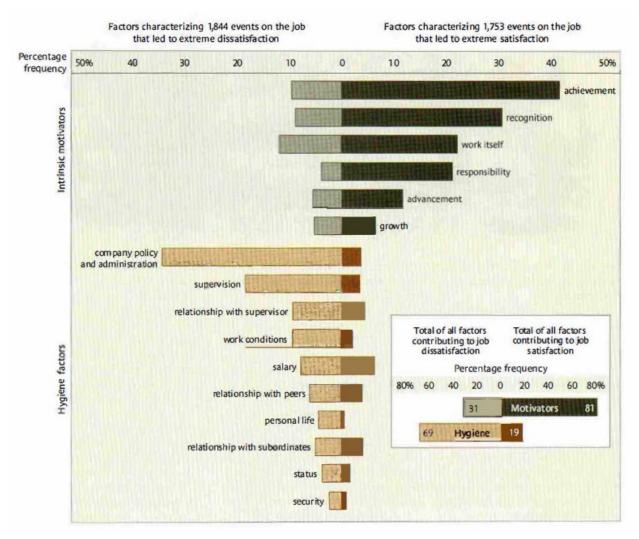

4. Human Relations Training. More than 30 years of teaching and, in many instances, of practicing psychological approaches to handling people have resulted in costly human relations pro- grams and, in the end, the same ques-tion: How do you motivate workers? Here, too, escalations have taken place. Thirty years ago, it was necessary to re-quest, "Please don't spit on the floor:' Today the same admonition requires three "pleases" before the employee feels that a superior has demonstrated the psychologically proper attitude. The failure of human relations train-ing to produce motivation led to the conclusion that supervisors or managers themselves were not psychologically true to themselves in their practice of interpersonal decency. So, an advanced form of human relations KITA, sensitivity training, was unfolded.

- 5. Sensitivity Training. Do you really, really understand yourself? Do you really, really, really trust other people? Do you really, really, really coop-erate? The failure of sensitivity training is now being explained, by those who have become opportunistic exploiters of the technique, as a failure to really (five times) conduct proper sensitivity training courses.
 - With the realization that there are only temporary gains from comfort and economic and interpersonal KITA, per-sonnel managers concluded that the fault lay not in what they were doing, but in the employee's failure to appre-ciate what they were doing. This opened up the field of communications, a new area of "scientifically" sanctioned KITA.
- 6. Communications. The professor of communications was invited to join the faculty of management training pro-grams and help in making employees understand what management was doing for them. House organs, briefing ses-sions, supervisory instruction

on the importance of communication, and all sorts of propaganda have proliferated until today there is even an Interna-tional Council of Industrial Editors. But no motivation resulted, and the obvious thought occurred that perhaps man-agement was not hearing what the em-ployees were saying. That led to the next KITA.

Exhibit 1 Factors affecting job attitudes as reported in 12 investigation

7. Two-Way Communication. Man-agement ordered morale surveys, sug-gestion plans, and group participation programs. Then both management and employees were communicating and lis-tening to each other more than ever, but without much improvement in mo-tivation.

The behavioral scientists began to take another look at their conceptions and their data, and they took human re-lations one step further. A glimmer of truth was beginning to show through in the writings of the so-called higher-order-need psychologists. People, so they said, want to actualize themselves. Unfortunately, the "actualizing" psy-chologists got mixed up with the human relations psychologists, and a new KITA emerged.

8. Job Participation. Though it may not have been the theoretical intention, job participation

often became a "give them the big picture" approach. For example, if a man is tightening 10,000 nuts a day on an assembly line with a torque wrench, tell him he is building a Chevro- let. Another approach had the goal of giving employees a "feeling" that they are determining, in some measure, what they do on the job. The goal was to pro-vide a sense of achievement rather than a substantive achievement in the task. Real achievement, of course, requires a task that makes it possible.

But still there was no motivation. This led to the inevitable conclusion that the employees must be sick, and therefore to the next KITA.

9. Employee Counseling. The initial use of this form of KITA in a systematic fashion can be credited to the Haw-thorne experiment of the Western Elec-tric Company during the early 1930s. At that time, it was found that the em-ployees harbored irrational feelings that were interfering with the rational oper-ation of the factory. Counseling in this instance was a means of letting the employees unburden themselves by talk-ing to someone about their problems. Although the counseling techniques were primitive, the program was large indeed.

The opposite of job dissatisfaction is not job satisfaction, but no job dissatisfaction.

The counseling approach suffered as a result of experiences during World War II, when the programs themselves were found to be interfering with the op-eration of the organizations; the coun-selors had forgotten their role of be-nevolent listeners and were attempting to do something about the problems that they heard about. Psychological counseling, however, bas managed to survive the negative impact of World War 11 experiences and today is begin-ning to flourish with renewed sophisti-cation. But, alas, many of these pro-grams, like all the others, do not seem to have lessened the pressure of demands to find out bow to motivate workers.

Since KITA results only in short-term movement, it is safe to predict that the cost of these programs will increase steadily, and new varieties will be devel-oped as old positive KITAs reach their satiation points.

Hygiene vs. Motivators

Let me rephrase the perennial question this way: How do you install a generator in an employee? A brief review of my motivation-hygiene theory of job atti-tudes is required before theoretical and practical suggestions can be offered. The theory was first drawn from an exami-nation of events in the lives of engineers and accountants. At least 16 other in-vestigations, using a wide variety of populations (including some in the Communist countries), have since been com-pleted, making the original research one of the most replicated studies in the field of job attitudes.

The findings of these studies, along with corroboration from many other in-vestigations using different procedures, suggest that the factors involved in pro-ducing job satisfaction (and motivation) are separate and distinct from the fac-tors that lead to job dissatisfaction. (See Exhibit 1, which is further explained below.) Since separate factors need to be considered,

depending on whether job satisfaction or job dissatisfaction is being examined, it follows that these two feelings are not opposites of each other. The opposite of job satisfaction is not job dissatisfaction but, rather, no job satisfaction; and similarly, the opposite of job dissatisfaction is not job satisfaction, but no job dissatisfaction.

Stating the concept presents a prob-lem in semantics, for we normally think of satisfaction and dissatisfaction as op-posites; i.e., what is not satisfying must be dissatisfying, and vice versa. But when it comes to understanding the behavior of people in their jobs, more than a play on words is involved.

Two different needs of human beings are involved here. One set of needs can be thought of as stemming from hu-mankind's animal nature - the built-in drive to avoid pain from the environ-ment, plus all the learned drives that become conditioned to the basic bio-logical needs. For example, hunger, a basic biological drive, makes it neces-sary to earn money, and then money becomes a specific drive. The other set of needs relates to that unique human characteristic, the ability to achieve and, through achievement, to experience psychological growth. The stimuli for the growth needs are tasks that induce growth; in the industrial setting, they are the job content. Contrariwise, the stimuli inducing pain-avoidance behav-ior are found in the job environment.

The growth or motivator factors that are intrinsic to the job are: achieve-ment, recognition for achievement, the work itself, responsibility, and growth or advancement. The dissatisfaction avoidance or hygiene (KITA) factors that are extrinsic to the job include: company policy and administration, supervision, interpersonal relationships, working conditions, salary, status, and security.

A composite of the factors that are involved in causing job satisfaction and job dissatisfaction, drawn from samples of 1,685 employees, is shown in Exhibit 1. The results indicate that motivators were the primary cause of satisfaction, and hygiene factors the primary cause of unhappiness on the job. The employ-ees, studied in 12 different investiga-tions, included lower level supervisors, professional women, agricultural ad-ministrators, men about to retire from management positions, hospital main-tenance personnel, manufacturing su-pervisors, nurses, food handlers, military officers, engineers, scientists, house-keepers, teachers, technicians, female assemblers, accountants, Finnish fore-men, and Hungarian engineers.

They were asked what job events had occurred in their work that had led to extreme satisfaction or extreme dissat-isfaction on their part. Their responses are broken down in the exhibit into per-centages of total "positive" job events and of total "negative" job events. (The figures total more than 100% on both the "hygiene" and "motivators" sides because often at least two factors can be attributed to a single event; advance-ment, for instance, often accompanies assumption of responsibility.)

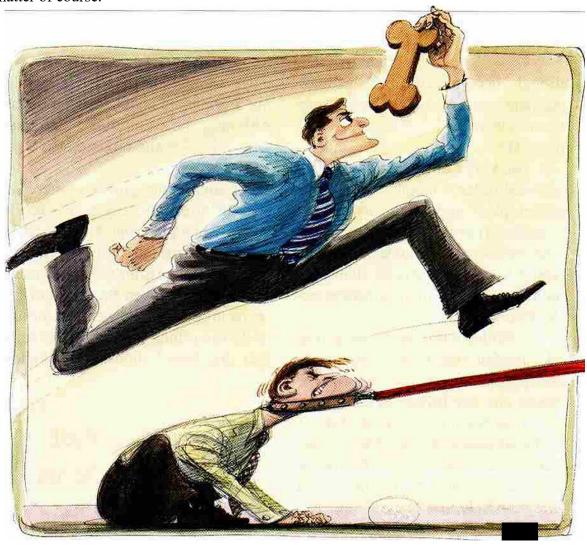

To illustrate, a typical response in-volving achievement that had a nega-tive effect for the employee was, "I was unhappy because I didn't do the job successfully" A typical response in the small number of positive job events in the company policy and administration grouping was, "I was happy because the company reorganized the section so that I didn't report any longer to the

guy l didn't get along with:'

As the lower right-hand part of the exhibit shows, of all the factors contributing to job satisfaction, 81% were motivators. And of all the factors con-tributing to the employees' dissatisfaction over their work, 69% involved hy-giene elements.

Eternal Triangle. There are three gen-eral philosophies of personnel manage-ment. The first is based on organiza-tional theory, the second on industrial engineering, and the third on behavioral science.

Organizational theorists believe that human. needs are either so irrational or so varied and adjustable to specific situ-ations that the major function of per-sonnel management is to be as prag-matic as the occasion demands. If jobs are organized in a proper manner, they reason, the result will be the most effi-cient job structure, and the most favor-able job attitudes will follow as a matter of course.

In attempting to enrich certain jobs, management often reduces the personal contribution of

employees rather than giving them opportunities for growth.

Industrial engineers bold that hu-mankind is mechanistically oriented and economically motivated and that human needs are best met by attuning the individual to the most efficient work process. The goal of personnel manage-ment therefore should be to concoct the most appropriate incentive system and to design the specific working conditions in a way that facilitates the most efficient use of the human machine. By structuring jobs in a manner that leads to the most efficient operation, engi-neers believe that they can obtain the optimal organization of work and the proper work attitudes.

Behavioral scientists focus on group sentiments, attitudes of individual em-ployees, and the organization's social and psychological climate. This persua-sion emphasizes one or more of the var-ious hygiene and motivator needs. Its approach to personnel management is generally to emphasize some form of human relations education, in the hope of instilling healthy employee attitudes and an organizational climate that is considered to be felicitous to human values. The belief is that proper atti-tudes will lead to efficient job and orga-nizational structure.

There is always a lively debate con-cerning the overall effectiveness of the approaches of organizational theorists and industrial engineers. Manifestly, both have achieved much. But the nag-ging question for behavioral scientists has been: What is the cost in human problems that eventually cause more ex-pense to the organization-for instance, turnover, absenteeism, errors, violation of safety rules, strikes, restriction of out-put, higher wages, and greater fringe benefits? On the other hand, behavioral scientists are hard put to document much manifest improvement in person-nel management, using their approach.

The motivation-hygiene theory sug-gests that work be enriched to bring about effective utilization of personnel. Such a systematic attempt to motivate employees by manipulating the moti-vator factors is just beginning. The term job enrichment describes this embryonic movement. An older term, job enlarge-ment, should be avoided because it is associated with past failures stemming from a misunderstanding of the prob-lem. Job enrichment provides the op-portunity for the employee's psycho-logical growth, while job enlargement merely makes a job structurally bigger. Since scientific job enrichment is very new, this article only suggests the prin-ciples and practical steps that have re-cently emerged from several successful experiments in industry.

Job Loading. In attempting to enrich certain jobs, management often reduces the personal contribution of employees rather than giving them opportunities for growth in their accustomed jobs. Such endeavors, which I shall call horizontal job loading (as opposed to verti-cal loading, or providing motivator factors), have been the problem of earlier job enlargement programs. Job loading merely enlarges the meaninglessness of the job. Some examples of this ap-proach, and their effect, are:

- Challenging the employee by increasing the amount of production ex-pected. If each tightens 10,000 bolts a day, see if each can tighten 20,000 bolts a day. The arithmetic involved shows that multiplying zero by zero still equals zero.
- Adding another meaningless task to the existing one, usually some rou-tine clerical

- activity. The arithmetic here is adding zero to zero.
- Rotating the assignments of a number of jobs that need to be enriched. This means washing dishes for a while, then washing silverware. The arithmetic is substituting one zero for another zero.
- Removing the most difficult parts of the assignment in order to free the worker to accomplish more of the less challenging assignments. This tradi-tional industrial engineering approach amounts to subtraction in the hope of accomplishing addition.

These are common forms of horizon-tal loading that frequently come up in preliminary brainstorming sessions of job enrichment. The principles of ver-tical loading have not all been worked out as yet, and they remain rather gen-eral, but I have furnished seven useful starting points for consideration in Exhibit 2.

A Successful Application. An exam-ple from a highly successful job enrich-ment experiment can illustrate the dis-tinction between horizontal and vertical loading of a job. The subjects of this study were the stockholder correspondents employed by a very large corporation. Seemingly, the task required of these carefully selected and highly trained correspondents was quite com-plex and challenging. But almost all in-dexes of performance and job attitudes were low and exit interviewing con-firmed that the challenge of the job ex-isted merely as words.

A job enrichment project was initi-ated in the form of an experiment with one group, designated as an achieving unit, having its job enriched by the principles described in Exhibit 2. A control group continued to do its job in the traditional way. (There were also two "uncommitted" groups of corre-spondents formed to measure the so-called Hawthorne effect - that is, to gauge whether productivity and atti-tudes toward the job changed artificially merely because employees sensed that the company was paying more attention to them in doing something dif-ferent or novel. The results for these groups were substantially the same as for the control group, and for the sake of simplicity I do not deal with them in this summary.) No changes in hy-giene were introduced for either group other than those that would have been made anyway, such as normal pay increases.

Principle	Motivators involved
A. Removing some controls while retaining accountability	Responsibility and personal achievement
B. Increasing the accountability of individuals for own work	Responsibility and recognition
 C. Giving a person a complete natural unit of work (module, division, area, and so on) 	Responsibility, achievement, and recognition
 D. Granting additional authority to employees in their activity; job freedom 	Responsibility, achievement, and recognition
E. Making periodic reports directly available to the workers themselves rather than to supervisors	Internal recognition
F. Introducing new and more difficult tasks not previously handled	Growth and learning
G. Assigning individuals specific or specialized tasks, enabling them to become experts	Responsibility, growth, and advancement

Exhibit 2 Principles of vertical job loading

The changes for the achieving unit were introduced in the first two months, averaging one per week of the seven motivators listed in Exhibit 2. At the end of six months the members of the achieving unit were found to be out-performing their counterparts in the control group and, in addition, indicated a marked increase in their liking for their jobs. Other results showed that the achieving group had lower absenteeism and, subsequently, a much higher rate of promotion.

Exhibit 3 illustrates the changes in performance, measured in February and March, before the study period began, and at the end of each month of the study period. The shareholder service index represents quality of letters, in-cluding accuracy of information, and speed of response to stockholders' let-ters of inquiry. The index of a current month was averaged into the average of the two prior months, which means that improvement was harder to obtain if the indexes of the previous months were low. The "achievers" were per-forming less well before the six-month period started, and their performance service index continued to decline after the introduction of the motivators, evidently because of uncertainty after their newly granted responsibilities. In the third month, however, performance improved, and soon the members of this group had reached a high level of accomplishment.

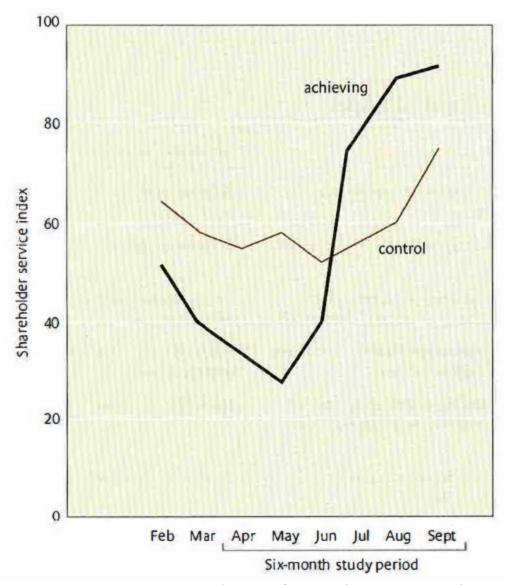

Exhibit 3 Employee performance in company experiment

Exhibit 4 shows the two groups' atti-tudes toward their job, measured at the end of March, just before the first motivator was introduced, and again at the end of September. The corre-spondents were asked 16 questions, all involving motivation. A typical one was, "As you see it, how many opportu-nities do you feel that you have in your job for making worthwhile contribu-tions?" The answers were scaled from 1 to s, with 80 as the maximum possi-ble score. The achievers became much more positive about their job, while the attitude of the control unit remained about the same (the drop is not statis-tically significant).

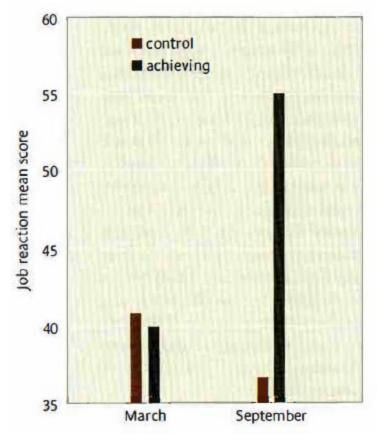

Exhibit 4 Change in attitudes toward tasks in company experiment

How was the job of these correspondents restructured? Exhibit s lists the suggestions made that were deemed to be horizontal loading, and the actual vertical loading changes that were in-corporated in the job of the achieving unit. The capital letters under "Princi-ple" after "Vertical Loading" refer to the corresponding letters in Exhibit 2. The reader will note that the rejected forms of horizontal loading correspond closely to the list of common manifestations I mentioned earlier.

Horizontal loading suggestions rejected Firm quotas could be set for letters to be answered each day, using a rate that would be hard to reach. The secretaries could type the letters themselves, as well as compose them, or take on any other clerical functions. All difficult or complex inquiries could be channeled to a few secretaries so that the remainder could achieve high rates of output. These jobs could be exchanged from time to time. The secretaries could be rotated through units handling different customers and then sent back to their own units. Vertical loading suggestions adopted Principle G Subject matter experts were appointed within each unit for other members of the unit to consult before seeking supervisory help. (The supervisor had been answering all specialized and difficult questions.) Correspondents signed their own names on letters. В (The supervisor had been signing all letters.) The work of the more experienced correspondents was proofread less frequently by supervisors and was done at the correspondents' desks, dropping verification from 100% to 10%. (Previously, all correspondents' letters had been checked by the supervisor.) Production was discussed, but only in terms such as "a full day's D work is expected." As time went on, this was no longer mentioned. (Before, the group had been constantly reminded of the number of letters that needed to be answered.) Outgoing mail went directly to the mailroom without going over A supervisors' desks. (The letters had always been routed through the supervisors.) C Correspondents were encouraged to answer letters in a more personalized way. (Reliance on the form-letter approach had been standard practice.)

Exhibit 5 Enlargement vs. enrichment of correspondents' tasks in company experiment

B, E

Each correspondent was held personally responsible for the

quality and accuracy of letters. (This responsibility had been

the province of the supervisor and the verifier.)

Steps for Job Enrichment

Now that the motivator idea has been described in practice, here are the steps that managers should take in instituting the principle with their employees:

- 1. Select those jobs in which
 - a. the in-vestment in industrial engineering does not make changes too costly,
 - b. attitudes are poor,
 - c. hygiene is becoming very costly, and
 - d. motivation will make a difference in performance.
- 2. Approach these jobs with the con-viction that they can be changed. Years of tradition have led managers to be-lieve that job content is sacrosanct and the only scope of action that they have is in ways of stimulating people.
- 3. Brainstorm a list of changes that may enrich the jobs, without concern for their practicality.
- 4. Screen the list to eliminate sugges-tions that involve hygiene, rather than actual motivation.
- 5. Screen the list for generalities, such as "give them more responsibility;" that are rarely followed in practice. This might seem obvious, but the motivator words have never left industry; the sub-stance has just been rationalized and organized out. Words like "responsibility," "growth;" "achievement;" and "chal-lenge;" for example, have been elevated to the lyrics of the patriotic anthem for all organizations. It is the old problem typified by the pledge of allegiance to the flag being more important than con-tributions to the country-of following the form, rather than the substance.
- 6. Screen the lisst to eliminate any hor-izontal loading suggestions.
- 7. Avoid direct participation by the employees whose jobs are to be en-riched. Ideas they have expressed previ-ously certainly constitute a valuable source for recommended changes, but their direct involvement contaminates the process with human relations hy-giene and, more specifically, gives them only a sense of making a contribution. The job is to be changed, and it is the content that will produce the moti-vation, not attitudes about being in-volved or the challenge inherent in set-ting up a job. That process will be over shortly, and it is what the employees will be doing from then on that will deter-mine their motivation. A sense of par-ticipation will result only in short-term movement.
- 8. In the initial attempts at job en-richment, set up a controlled experi-ment. At least two equivalent groups should be chosen, one an experimental unit in which the motivators are sys-tematically introduced over a period of time, and the other one a control group in which no changes are made. For both groups, hygiene should be allowed to follow its natural course for the duration of the experiment. Pre-and post-installation tests of performance and job attitudes are necessary to evaluate the effectiveness of the job enrichment program. The attitude test must be lim-ited to motivator items in order to di-vorce employees' views of the jobs they are given from au the surrounding hy-giene feelings that they might have.
- 9. Be prepared for a drop in performance in the experimental group the first few weeks. The changeover to a new job may lead to a temporary re-duction in efficiency.
- 10. Expect your first-Line supervisors to experience some anxiety and hostil-ity over the changes you are making. The anxiety comes from their fear that the changes will result in poorer per-formance for their unit. Hostility will arise when the employees start assuming what the supervisors regard as their own responsibility for performance. The supervisor without checking du-ties to perform may then be left with Little to do.

After successful experiment, however, the supervisors usually discover the supervisory and managerial functions they have neglected, or which were never theirs because all their time was given over to checking the work of their subordinates. For example, in the R&D division of one large chemical company I know of, the supervisors of the labo-ratory assistants were theoretically re-sponsible for their training and evalu-ation. These functions, however, had come to be performed in a routine, un-substantial fashion. After the job en-richment program, during which the supervisors were not merely passive ob-servers of the assistants' performance, the supervisors actually were devoting their time to reviewing performance and administering thorough training.

What has been called an employee centered style of supervision will come about not through education of super-visors, but by changing the jobs that they do.

Job enrichment will not be a one-time proposition, but a continuous manage-ment function. The initial changes should last for a very long period of time. There are a number of reasons for this:

- The changes should bring the job up to the level of challenge commensurate with the skill that was hired.
- Those who have still more ability eventually will be able to demonstrate it better and win promotion to higher level jobs.
- The very nature of motivators, as opposed to hygiene factors, is that they have a much longer-term effect on em-ployees' attitudes. rt is possible that the job will have to be enriched again, but this will not occur as frequently as the need for hygiene.

Not all jobs can be enriched, nor do all jobs need to be enriched. If only a small percentage of the time and money that is now devoted to hygiene, however, were given to job enrichment efforts, the return in hum.an satisfaction and eco-nomic gain would be one of the largest dividends that industry and society have ever reaped through their efforts at bet-ter personnel management.

The argument for job enrichment can be summed up quite simply: If you have employees on a job, use them. If you can't use them on the job, get rid of them, either via automation or by se-lecting someone with lesser ability. if you can't use them and you can't get rid of them, you will have a motivation problem. \Box
